

The structural element shown is based on the axis A1,200 as well as on the axes A300 and A600, which are positioned orthogonally to this axis. In this combination of axes, the connecting tube, which runs diagonally from A300 to A600, also corresponds to axis A1,200.

In all other combinations of axes, the diagonal connecting tube needs to be complemented by a special axis (cf. calculator: constructiv PON Flex ? tube lengths).

Of course, all diagonal braces correspond to the standard lengths.
